Visual Evidence

One observed moment

Image evidence prompt

Submit one original screenshot or still of your Case Study 1 Atari game. Caption it with the title, version or platform when known, the scene shown, and its source. A relevant image from your first case study may be reused.

Requirements and potential deductions

- The image shows the original scene used for this redesign. (up to -0.5 points)
- The caption identifies the selected Atari game, scene, and image source. (up to -0.5 points)

Caption: This scene is from the first level, on the Atari 2600 version of the game.

Visual Redesign

Improvement goal

Response prompt

Identify one visual problem in the original scene and explain the mood or player experience your redesign should support. Refer to a specific detail in the original image.

Requirements and potential deductions

- Identifies a visual problem using a specific detail from the original scene. (up to -0.75 points)
- Explains the intended mood or player experience of the redesign. (up to -0.75 points)

Submitted response

Immediately the player is presented with 3 separate paths, with one blocked off by a brick wall and another having a log in the
As the player, I wouldn't have chosen going down or left as going left in any platformer is (usually) counterintuitive. I think the
redesign would be something as simple as a sign next to the ladder or a torch in the cave signifying there are two ways to go ra
than just having the ladder go down to a brick wall. I think by also adding some fog/smoke, it'll attract more attention to the cav

Revised palette

Response prompt

List your proposed colors and their roles, including any neutrals. Explain why this palette size and a named color relationship suit your improvement goal, and how contrast makes an important element stand out. Color names or swatches are sufficient; exact color codes are optional.

Requirements and potential deductions

- Identifies the proposed colors and what each is used for. (up to -0.5 points)
- Justifies the palette size and a named color relationship using the improvement goal. (up to -0.75 points)
- Explains a contrast choice that makes an important element stand out. (up to -0.75 points)

Submitted response

The easiest color would just be a bright red and orange torch next to the left exit in the cave. The contrast alone of a bright torc
against the pitch-black cave walls and hazy fog would be enough for the player to understand that there is stuff down there. Th
palette can stay simple because it's just a torch guiding the player, and the last thing we want is a juxtaposition with the game's
design. A torch fits better in a jungle than a green glowstick or red rope along the walls.

Redesigned scene

Image evidence prompt

Submit a colored sketch, annotated recoloring, or mockup of the same scene using your proposed palette. Include a gameplay element and an interface or state indicator. Keep an important state understandable without color alone, using a label, shape, or icon. Caption the image to identify the scene and your changes.

Requirements and potential deductions

- The redesign applies the proposed palette to the same scene's gameplay element and interface or state indicator. (up to -1.25 points)
- An important state has an understandable label, shape, or icon in addition to its color. (up to -1.25 points)

Caption: The redesign with the haze/smoke, and the ever so helpful torch.

Look and feel decision

Response prompt

Explain one visual change beyond the palette, such as composition, interface layout, character shape, or an animation you would add. Connect it to a relevant Chapter 6 concept from vision, interface, ambience, or storytelling and explain its intended effect on the player. Describe motion in words if your sketch cannot show it.

Requirements and potential deductions

- Connects a specific visual change beyond the palette to a relevant Chapter 6 concept. (up to -0.75 points)
- Explains how that change would affect the player's experience. (up to -0.75 points)

Submitted response

I would like to add animals or background effects to the jungle. It just being a murky green makes it easy to concentrate on timi jumps and not distracting you, is very plain, and adds something as simple as monkeys swooping around or a lepard looking in camera and hiding would make for better ambience.

Evaluate the redesign

Response prompt

Compare your redesign with the original scene. Explain how the revised visuals work together to address your improvement goal while keeping the game's core actions and rules. Refer to a specific difference visible in the two images.

Requirements and potential deductions

- Evaluates the combined effect of the revised visuals on the improvement goal using a specific before-and-after difference. (up to -0.75 points)
- Explains how the original core actions and rules remain intact. (up to -0.75 points)

Submitted response

Well, the game is still kept the same, with the difference of having the torch in the scene now better communicate the options t

player has when progressing through the game. The objects and player movement are still the exact same.
